

Firefox is the recommended browser for this site. If you are using Internet Explorer 8 please read below.

Internet Explorer's Cross-Site Scripting (XSS) Filter can help prevent one website from adding script code to another website. XSS Filter watches how websites interact, and when it recognizes a potential attack, it will automatically block script code from running. When this happens, you will see a message in the Information bar letting you know that the webpage was modified to help protect your privacy and security.

If you would like to disable the filter, follow the instructions below AT YOUR OWN RISK.

- In Internet Explorer click the "Tools" menu then "Internet Options".
- Select "Security", then "Custom Level".
- Scroll almost to the bottom and under the "Scripting" category look for the "Enable XSS Filter" setting and select "Disable".
- "OK" everything and agree to any warnings.
- Restart IE and it should work for you.

Again - "USE AT YOUR OWN RISK".
